

Developer Team,

After reviewing the requirements document, we would like to request some changes in the functionality of the system. We believe that these changes would improve the user experience on the application and provide important features and functions of the system.

- User Authentication: With several different user types accessible in the system. Having an authentication layer would help prevent unauthorized access of the “Instructor” accounts and improve the security of the system.
  - User Profile: We want to allow a user to create a profile where they can add their personal information, such as name, email address, and profile picture. Inclusive of an authentication layer, having a user profile would support this structure.
- Notifications: We want to implement a notification system that will notify users when they receive new messages, notifications about marks, comments on assignments. This will help to keep users engaged and informed about activity on the platform.

We believe these changes would improve the overall functionality of the system and provide a greater user experience than before. We would appreciate it if you could review these changes and let us know if they are feasible to implement within the given timeline. If you have any questions or concerns, please don't hesitate to contact us.

Thank you for your time and hard work.

Client Team
